

Live Telemetry. Cryptographic Proof. Real Revenue.

CMXS Media XStream is a fully operational, live ecosystem.

This presentation outlines the exact implementation plan to translate sub-300ms MoQ streaming and on-chain Proof of Delivery into verifiable local TV advertising dollars.

Everything shown is running on live infrastructure today.

The Five-Layer Glass-Box Architecture

A complete, end-to-end FAST channel stack operating on complete cryptographic transparency.
You bring the content; CMXS provides the delivery, the auction, and the proof.

The Measurement Vacuum Meets the \$45 CPM Opportunity

Layer 1: The Media over QUIC (MoQ) Delivery Revolution

Traditional HLS/TCP

Produces 2-6 second segments.
A single lost packet causes head-of-line blocking, halting the entire stream.

Typical FAST latency:
10-30 seconds.

CMXS MoQ (Caton)

Publishes independent video objects over UDP/QUIC.

Lost packets do not block other frames.

Fan-out scales infinitely.

The Result: 200-300ms glass-to-glass latency at CDN-scale fan-out.

Layer 2: The Physical DePIN Edge via EchoStar

The DePIN Advantage:

CMXS utilizes 5,800 physical EchoStar tower sites as DePIN edge nodes, bypassing congested cloud CDNs.

Equitable Latency:

A local TV station in a small DMA receives the exact same sub-300ms delivery speed as a broadcast in New York.

How it Works:

Towers connect directly to the CMXS ingest cluster via MPLS/dark fiber, serving video objects straight to the geographic coverage area.

Layer 3: The 600-Millisecond OpenRTB Auction

Your local auto dealer sets a max bid of \$45 to target confirmed humans watching your FAST channel in the exact DMA. The auction completes, and the ad is stitched directly into the stream in under 600 milliseconds. No fraud. No bots.

Layer 4: Cryptographic Proof of Delivery (PoD)

Device-Level Autonomy

At 100% completion, the SDK autonomously generates an ECDSA signature.

Oracle Verification

The PoD Oracle applies ML anomaly scoring and verifies the signature against registered wallets.

On-Chain Receipt

DeliveryOracle.sol mints an immutable public receipt on the Base L2 network, making every impression auditable.

SYNTHESIS: The 35-Second Economic Engine

Infrastructure, Not Competition: Local TV stations retain 85% of the gross verified CPM—vastly outperforming traditional 50–65% revenue shares.

The Local TV Value Proposition

A local station generates \$1.83M in net new annual digital revenue from their existing linear sports feed, delivered on a white-label basis.

Audience Baseline:	500,000	Monthly Active Viewers
Gross Inventory:	4,000,000	Monthly Impressions
The Verified Multiplier:	\$45	Verified CPM
Gross Monthly Ad Revenue: \$180,000		
Content Partner Net (85%): \$153,000 / month		
Capital Expenditure: \$0.00		

The Latency & Verification Matrix

Moving inventory from the unverified to the cryptographically verified tier unlocks 2–3x the CPM on identical video content.

Dimension	Traditional FAST (Unverified)	Third-Party (DV/IAS)	CMXS PoD (On-Chain)
Latency	10-30 seconds	10-30 seconds	200-300ms
Ad Fraud Risk	High (Spoofing)	Medium (Heuristics)	Negligible (ECDSA)
Auditability	None (Black Box)	Partial (Sampled)	Immutable (Base L2)
Target CPM	\$10-\$25	\$20-\$35	\$45-\$65+

The BME Tokenomics Flywheel

Structural Demand: Mechanical burn is non-discretionary. Verifiable on-chain buying pressure is rooted in corporate advertising budgets, not retail speculation.

Network Valuation & Node Operator Economics

The Valuation Multiple

Dimension	Rev / Metric	FDV (Fully Diluted Valuation)	Implied Multiple
Helium (HNT)	\$24M Rev	~\$500M FDV	~21x Multiple
Render (RENDER)	\$15M Rev	~\$1.5B FDV	~100x Multiple
Akash (AKT)	428% YoY Growth	~\$350M FDV	~25x Multiple
CMXS Target (Yr 3)	\$23.1M Rev	\$150M-\$200M FDV	Conservative 20-35x

Targeting a conservative 20x multiple leaves structural upside as on-chain milestones are hit.

Node Reward Calculation

500k Viewers × 4.5 Impressions^A

× 0.001 CMXS Node Reward^B

= 2,250 CMXS / Month^C

Total Node Yield:
\$22,500 / month
(Assumes \$10/CMXS value)

Go-To-Market: The 3-Node Cold Start

De-risking the Pitch: The pilot requires zero technology cost from the broadcaster. If verified PoD numbers don't beat current CPMs in 90 days, they walk away.

Platform Roadmap & Path to Profitability

EBITDA Positive: Pre-seed funding ensures runway through the Month 18 inflection point, where protocol revenue overtakes operating expenses.

The Close: The 90-Second Demo Pitch

Three questions matter: Will they watch? Will advertisers pay? Does it work?
The demo answers all three in under two minutes.

1. The Stream

See the Latency. Trigger the MoQ live stream; demonstrate sub-300ms glass-to-glass delivery.

2. The Dashboard

See the Bid. Trigger a synthetic request; show the winning \$45 programmatic bid in real time.

3. Basescan

Block	Age	Type	Status	Proof of Delivery (PoD)	Value
128495	2s ago	PoD Receipt	Confirmed	0x7d2a...e3f1	\$45.00

See the Proof. Show the immutable PoD receipt appearing within seconds of ad completion.

Call to Action: Activate your 90-day, zero-CapEx local TV pilot today. Verified revenue starts on day one.
