

FAST sports viewership is surging, but legacy infrastructure traps the revenue.

TIMESTAMP: 2024-10-27 14:32:05 UTC | FLOW_ID: FAST_SPORTS_REV_LEAK | SYSTEM_STATUS: NOMINAL

The Verification Divide: Unlocking the \$45+ Premium Tier

TIMESTAMP: 2024-10-27 14:33:15 UTC | FLOW_ID: CMXS_VERIFICATION_DIVIDE | SYSTEM_STATUS: NOMINAL

	Status Quo	CMXS Standard
Delivery Protocol	TCP/HLS – 6–10s latency, buffering ⚠	MoQ over QUIC – <300ms glass-to-glass ✓
Ad Bidding	Static rules, delayed fill	OpenRTB 2.6, Dynamic SSAI pod structuring
Fraud Prevention	Third-party proprietary, easily spoofed	ECDSA device signatures
Audit Trail	Siloed internal reporting	Immutable Base L2 EVM Ledger
Target CPM Yield	\$15–\$25 Unverified	\$45–\$65 Verified Premium

CMXS does not just build better streaming tech; it builds the cryptographic bridge to premium AdTech liquidity.

MoQ: The sub-300ms catalyst that makes real-time bidding possible.

TIMESTAMP: 2024-10-27 14:34:00 UTC | FLOW_ID: MOQ_RTБ_CATALYST | SYSTEM_STATUS: NOMINAL

⚠ Legacy TCP/HLS

Reliant on TCP.

One dropped packet stalls the entire 6-second segment.

Result: Buffering.

✅ Media over QUIC (MoQ)

UDP-based publish/subscribe relay.

Parallel object delivery eliminates head-of-line blocking.

The Financial Impact: <300ms latency creates the critical time-window required to run a full OpenRTB programmatic auction before the ad break without stalling the stream.

The Physical Edge: 5,800 EchoStar Tower Nodes.

TIMESTAMP: 2024-10-27 14:35:00 UTC | FLOW_ID: CMXS_EDGE_NODES | SYSTEM_STATUS: NOMINAL

CMXS is not purely cloud-based. It utilizes a **Decentralized Physical Infrastructure Network (DePIN)**.

5,800 EchoStar tower sites act as last-mile delivery nodes via dark fiber or MPLS private circuits.

Video objects bypass congested internet backbones, beaming directly to viewer devices in the local geographic coverage area.

Node operators earn CMXS tokens per verified cache hit, incentivizing physical network growth.

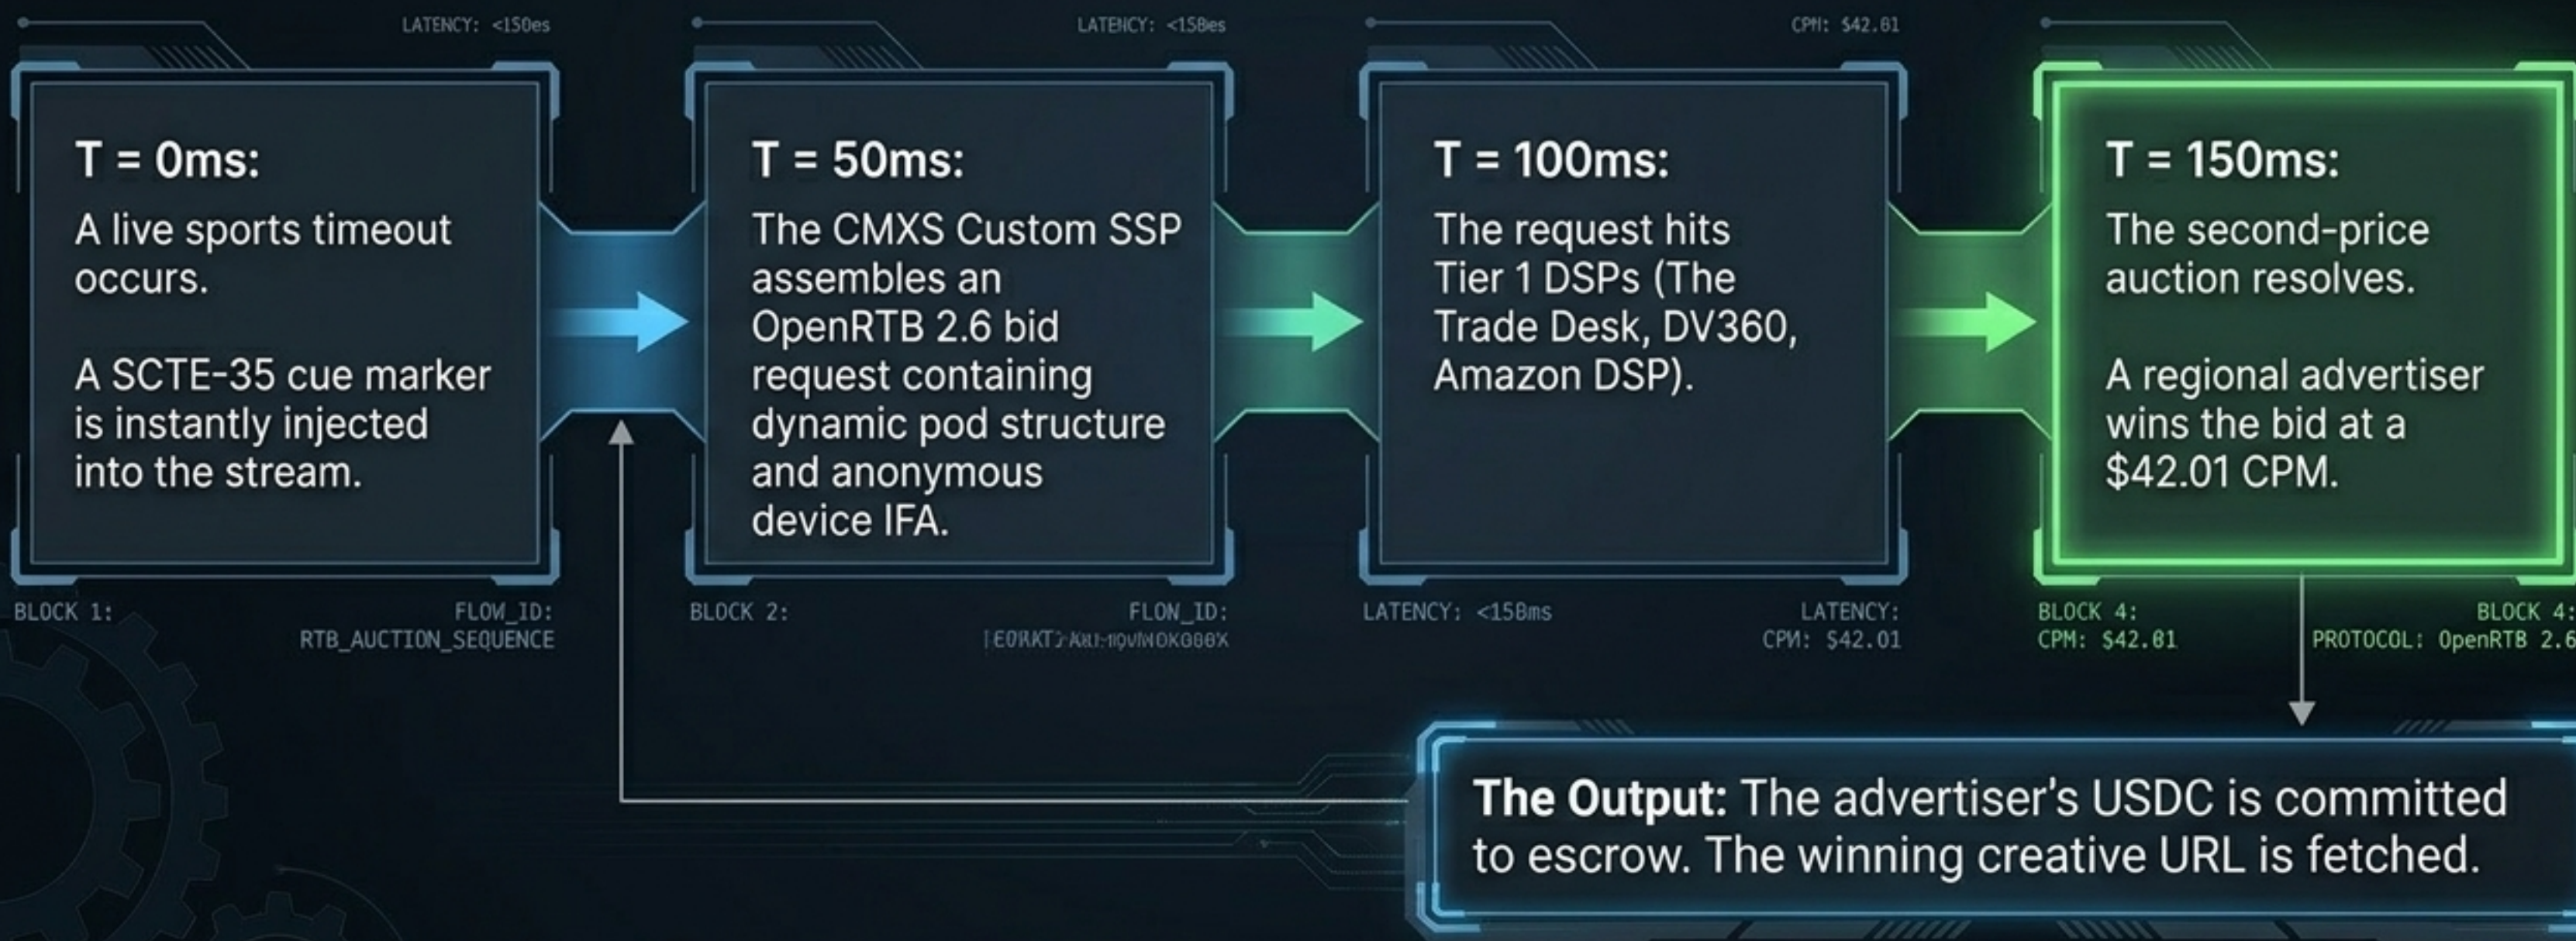

CMXS leverages the EchoStar DePIN to deliver video content with the lowest possible latency and highest cryptographic certainty.

T = 00.000s

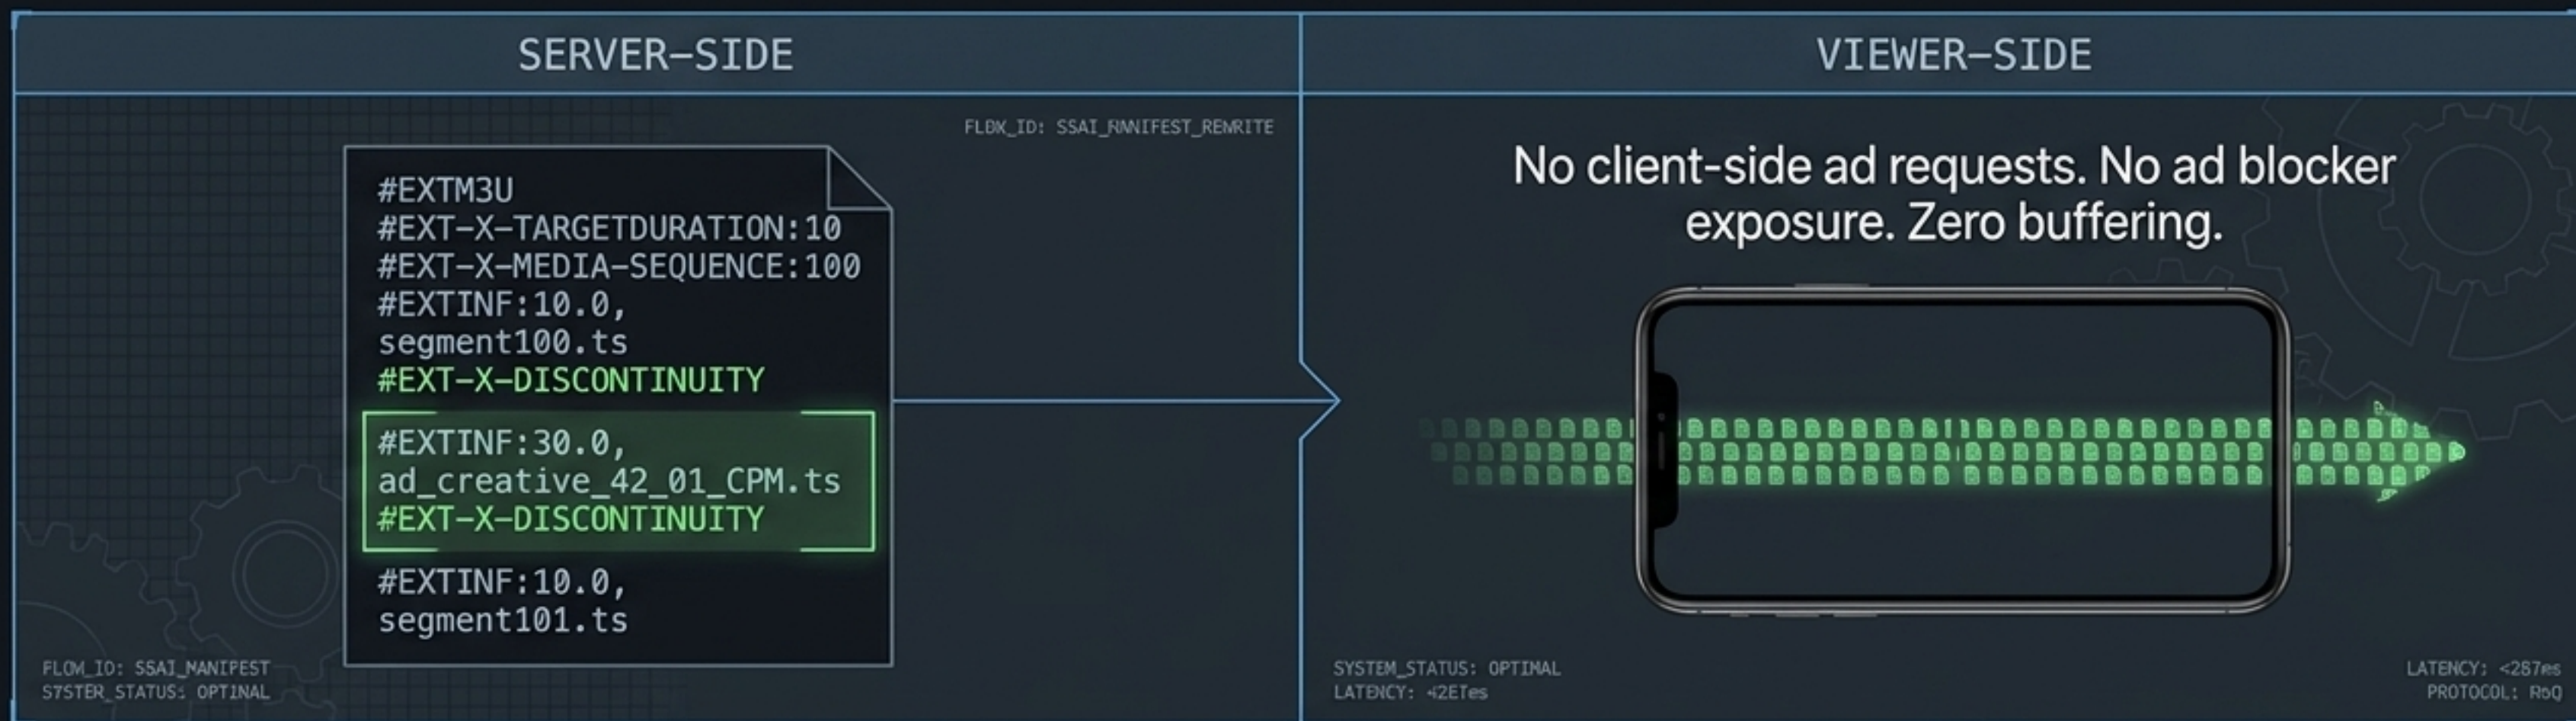

T = 0ms to 150ms: The OpenRTB Auction.

TIMESTAMP: 2024-10-27 14:35:00 UTC | FLOW_ID: RTB_AUCTION_SEQUENCE | SYSTEM_STATUS: OPTIMAL

T = 00.287s

T = 287ms: Zero-Buffer Server-Side Delivery.

T = 287ms: MediaTailor intercepts the manifest and rewrites it with EXT-X-DISCONTINUITY tags, injecting the pre-transcoded \$42.01 ad creative.

The viewer's device receives a single, continuous MoQ stream.

The Output: The 30-second ad begins playing with sub-300ms glass-to-glass latency.

T = 20.000s

T = 20s: The x402 Interactive Commerce Activation.

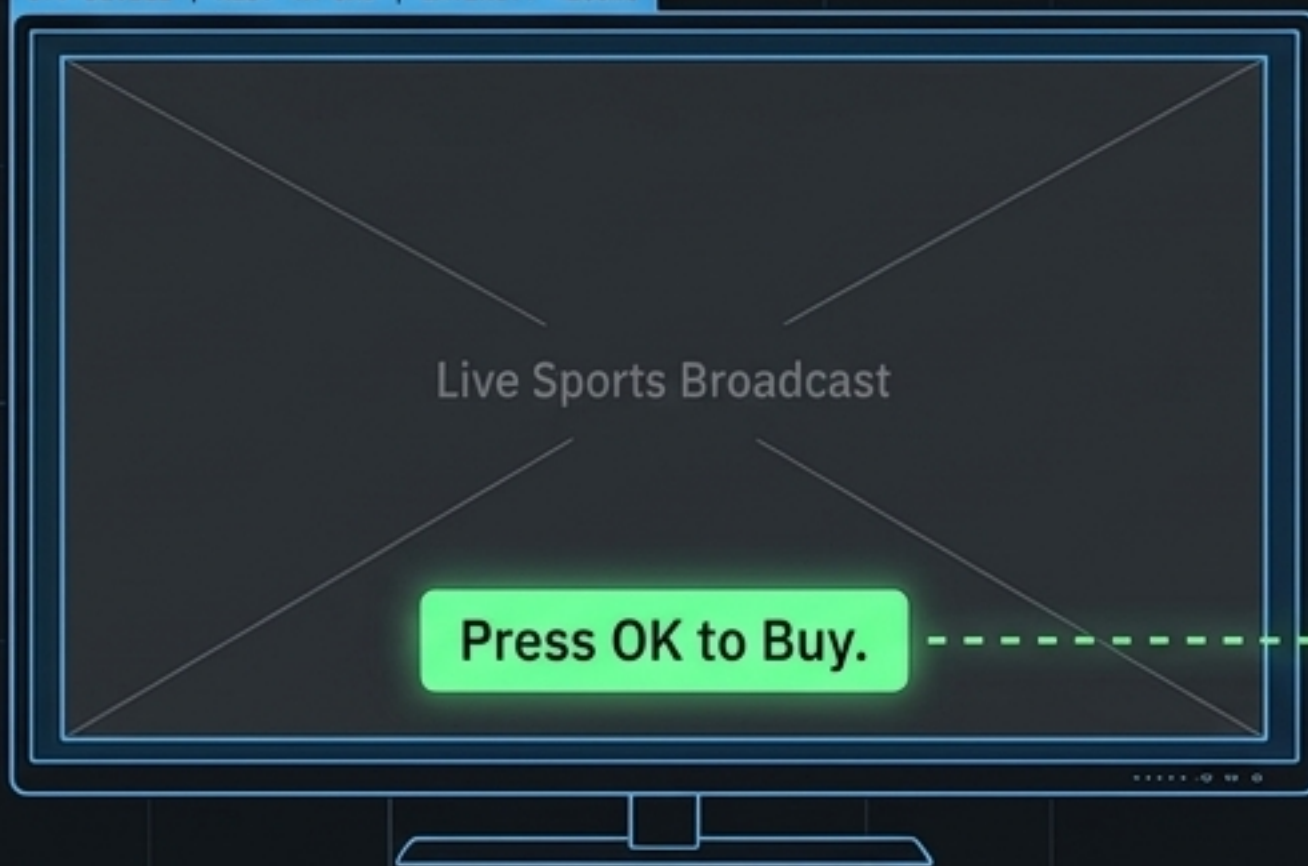

TIMESTAMP: 2024-10-27 14:35:20 UTC | FLOW_ID: INTERACTIVE_COMMERCE_ACTIVATE | SYSTEM_STATUS: OPTIMAL

At the 20-second mark of the ad,
➤ a VAST non-linear extension triggers the x402 commerce overlay.

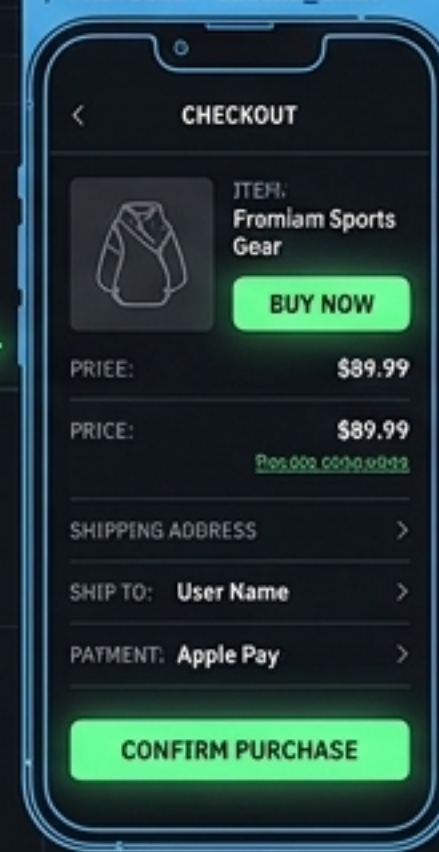

➤ The viewer presses "OK" on their remote control.

A frictionless purchase flow opens on the viewer's paired mobile device,
➤ completely bypassing the friction of QR codes or second-screen app downloads.

CTV DEVICE | RES: 4K UHD | LATENCY: <200ms

MOBILE DEVICE | IOS/ANDROID
| PROTOCOL: SECURE_LINK

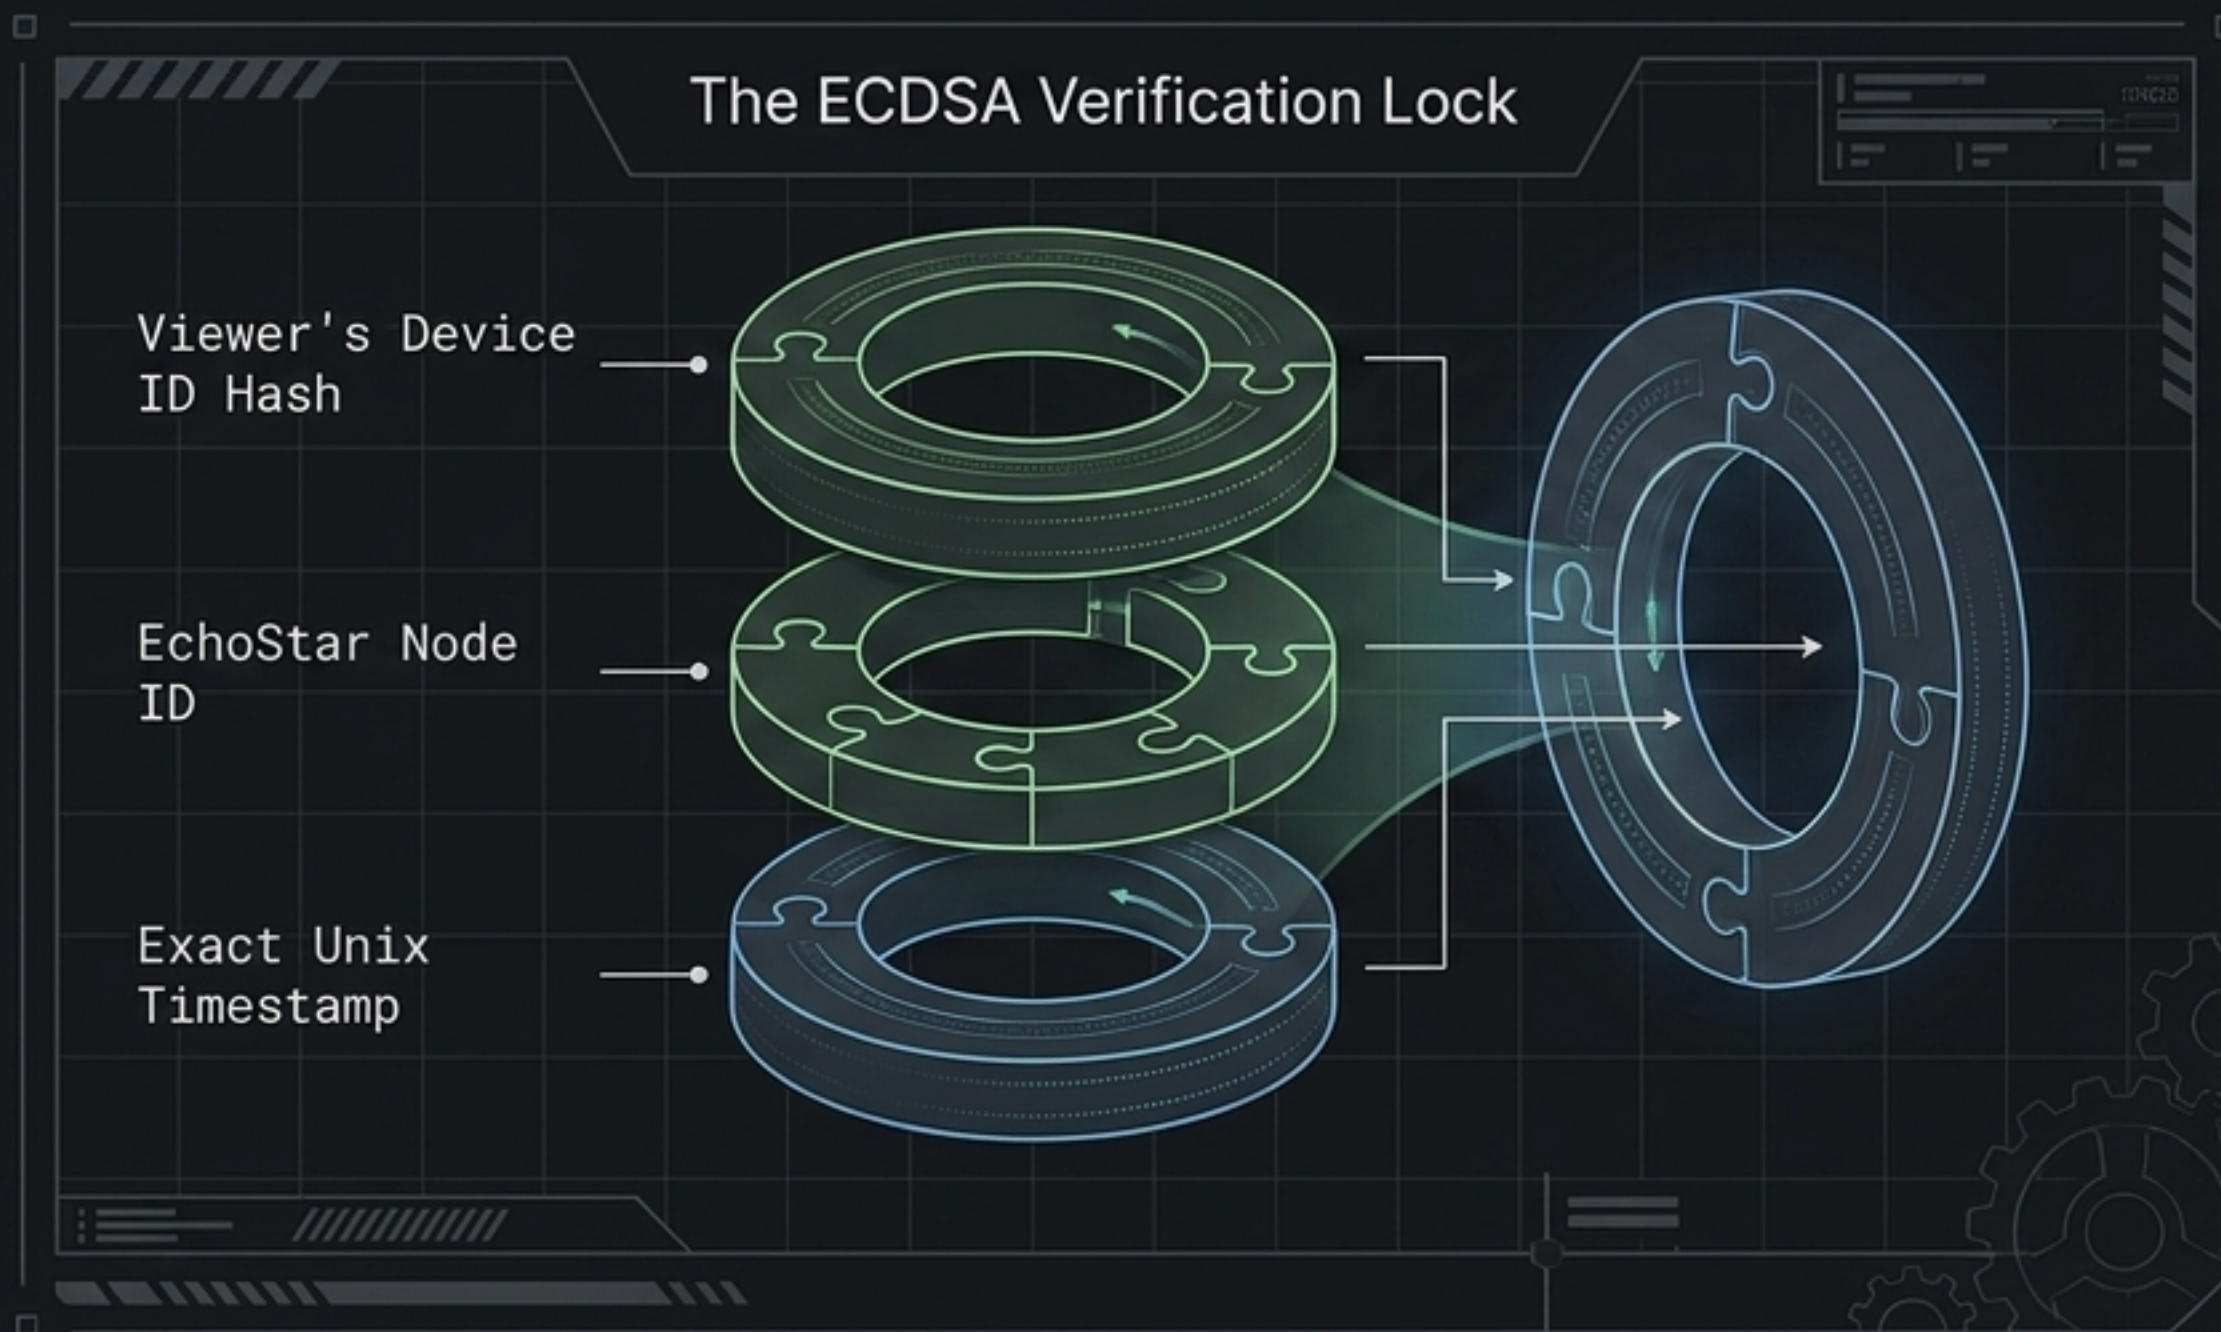

FLOW_ID: COMMERCE_CONVERSION | LATENCY: <100ms | PROTOCOL: x402_SECURE

The Output: This interaction drives 3-8% conversion rates and \$60-\$120 average purchase values, generating an additional 1.5% transaction fee for the CMXS protocol.

$T = 30.000s$

$T = 30s$: The Cryptographic Proof-of-Delivery (PoD).

When the ad reaches 100% completion, the CMXS device SDK autonomously generates an ECDSA signature.

It fuses the anonymous device identity, the delivering node, and the exact millisecond of completion.

This signature cannot be fabricated, replicated, or spoofed by bot farms.

The Output:

The traditional, easily-gamed third-party verification vendor is replaced by absolute mathematical certainty.

T = 35.000s

T = 35s: Base L2 Settlement & Revenue Split.

TELEMETRY:
TBLBNANP: WEB00LE
F0LEANDRY: 14B.6MD, 1DLLE0JIMS

The PoD receipt is transmitted
➤ to DeliveryOracle.sol on Base L2.

The Oracle verifies the
➤ signature, ML anomaly scores, and latency SLAs.

An immutable receipt is
➤ minted on-chain, triggering instant, human-free financial settlement.

0.001 CMXS is minted
to the EchoStar tower
operator for delivering
the verified impression.

The Burn-Mint Equilibrium: Token demand driven by corporate ad spend.

BME Mechanical Loop

Continuous Economic Flow

Mechanism Explanation

- Advertisers pay fiat USDC for verified premium impressions.
- The AdBurn.sol contract automatically burns CMXS proportionally to every dollar of ad spend.
- More ad revenue → more CMXS burned → circulating supply decreases.
- Higher token value increases fiat-equivalent yield for node operators, attracting more physical EchoStar capacity.

The Insight: This is not a speculative token. It is a deflationary settlement mechanism mechanically linked to a market growing at 43% annually.

Institutional Valuation Comparables

T = 35.000s

	Revenue	Market Cap	Multiple
Helium (HNT)	\$24M Revenue	~\$500M Market Cap	~21x Multiple
Render (RENDER)	\$15M Revenue	~\$1.5B Market Cap	~100x Multiple
Akash (AKT)	428% YoY Growth	~\$350M Market Cap	~25x Multiple
CMXS (Year 3 Base Case)	\$23.1M Revenue	Target \$150M–\$200M Initial FDV	Conservative 20x Target

Leading DePIN networks trade at 10–25x on-chain revenue. A \$150M–\$200M initial FDV at TGE provides structural upside as the burn flywheel activates.

Partner Unit Economics: The impact on a single local sports channel

For local TV General Managers facing the loss of Nielsen monitoring in 137 markets, CMXS provides an independently auditable, premium digital product with zero upfront CapEx.

The 5-Layer Structural Moat.

Moat Diagram

The Strategic Reality: Competitors like DAZN and LIV Golf distribute free sports but lack verified ad infrastructure. CMXS is not competing with them for content; CMXS is selling them the engine that makes their free streaming model profitable.

Not a Whitepaper Concept. Live Infrastructure.

See the Speed: The Caton MoQ stream delivers live sports with <300ms glass-to-glass latency globally, today.

See the Auction: The OpenRTB 2.6 custom SSP resolves real-time bids dynamically.

See the Proof: DeliveryOracle.sol mints immutable PoD receipts on the Base Sepolia testnet in under 5 seconds.

The technology works. The advertiser demand for verified sports exists. The tokenomics are mechanically sound.
