

Engineering the Future of Sports FAST Advertising

Validating the Arenza Architecture:
Market Convergence, Risk Mitigation,
and Tactical Implementation

The Global FAST Surge: 20.9% CAGR

US Market Share Shift

FAST is projected to capture 35% of total US TV ad revenue by 2025, surging from 17% in 2023.

The Live Sports Premium

Live sports CTV commands \$30–\$60 CPMs compared to standard FAST CPMs of just \$11. The top 4 sports properties currently command 87.4% of total media spend.

The SMB Entry Point

Through programmatic FAST targeting (down to zip-code level), local sports bars and restaurants can now access this premium inventory for \$200–\$500 per campaign.

The Target Behavior: Monetizing the Second Screen

The Multi-Screen Baseline

Nearly 90% of sports fans actively use a second screen while watching live matches.

The Intent Trigger

69% of TV sports watchers use their mobile device to research a product immediately after seeing an ad.

The Early Adopters

17% of Gen Z second-screener have scanned a branded QR code in the past month.

The Burning Platform: Standard Video Interruption is Structurally Failing

Collapse of the Mid-Roll

Completion rates for ads over 20 seconds have plummeted from 82% to 57%.

The 5-Second Exit

68% of 30-second pre-rolls are skipped within the first five seconds of playback.

Total UX Failure

Interruptive mid-rolls destroy live sports viewing, driving 42.7% of global viewers to use ad-blocking software.

The Inevitable Center of Gravity

Arenza is the precise mathematical convergence point of the \$93.79 billion loyalty and \$12.28 billion FAST advertising markets.

Incumbent Validation: The Macro Pivot to Interactivity

The Pattern: **Video + Real-Time Interactivity + Commerce Layer**. The incumbents are validating the behavioral model, leaving the specific local SMB vertical open for Arenza.

The Arenza Product Architecture: Structural Immunity to Ad Fatigue

Zone 1: Low-Latency Video

Live Sports FAST broadcast remains completely uninterrupted. Zero mid-roll ad interruptions.

Zone 2: Gamified Interaction

Opt-in spin/scratch mechanics driving an observed **3.31% engagement rate** (nearly 3x standard video). The ad is the interactive content.

Zone 3: Digital Reward Wallet

Persistent, secure housing for time-sensitive, location-based sponsor rewards ready for immediate offline use.

The White Space Map: Uncontested Market Positioning

Platform	Video Layer	Interactive Layer	Local SMB Targeting	QR Attribution	Offline Redemption
Arenza	Sports FAST stream	Gamified spin/scratch	✓ Location + preference	✓ POS-linked	✓ Physical reward claim
Roku Ads Manager	CTV/streaming	QR overlays, shoppable	✓ Zip-level geo	Partial	✗
StreamLayer	Sports live stream	Polls, predictions, stats	✗ Enterprise only	✗	✗
BrightLine	CTV	Remote-interactive games	✗ National brands	✗	✗
Genius BetVision	Sports live stream	Betting integration	✗	✗	✗
DraftKings x Amazon	NFL/NBA streams	Odds, parlays	✗	✗	✗
Tubi	FAST broad	Standard pre/mid-roll	✓ Regional data	✗	✗

Conclusion: While giants own individual vertical siloes, only Arenza occupies the complete operational intersection of sports streaming, SMB geo-targeting, and offline physical redemption.

Solving the Holy Grail: Closed-Loop Attribution Engine

The Silent Moat: Zero-Party Data Generation

The Privacy Imperative

As third-party tracking vanishes (Apple ATT, Android Privacy Sandbox), zero-party data voluntarily provided by users becomes the only durable asset.

On-Device ProfileEngine

Machine Learning processes interaction signals entirely on-device. No raw behavioral data ever leaves the user's phone.

The Output

Generates perfectly anonymized preference vectors for ad targeting. Direct industry analog: Sportradar's validated FanID platform.

Diagnostic: Dismantling the QR Code 'Ceiling' Myth

The Myth: 0.004% Scan Rate

Data measuring TV-to-Mobile bridging requires a user to cross a room, open a camera, and point it at a large screen. This relies on high-friction, cross-device action.

The Arenza Reality: Wallet-to-POS

The entire experience is native to one device. The QR code lives persistently in the mobile wallet and is scanned instantly at the counter.

The True Benchmark: Planters' interactive QR campaign achieved a 70% scan-to-action conversion rate when utilizing low-friction mechanics.

Addressing the Greatest Risk: The Companion App Retention Crisis

The Crisis

The Threat:

Companion apps face a massive 70–80% retention drop within 30 days. Users download for one game and quickly abandon.

The Solution: Temporal Habit Mechanics

Product Evolution: Preventing Engagement Fatigue

Format 1: Predict & Spin

Ties interactivity deeply to broadcast outcomes. Users predict the next scorer or final score for enhanced odds. IBM research confirms 91% of fans engage with **real-time** digital enhancements during live events.

Format 2: The Scratch Card

Prevents spin-fatigue by alternating game mechanics to maintain novelty. Rewarded video mechanics in mobile gaming (the closest industry analog) demonstrate massive 53–68% retention rates.

Scaling the QR Wallet: Leveraging Native OS Habits

The Adoption Reality	The Re-Engagement Engine
80% of customers save an Apple Wallet pass when offered, whereas only 22% are willing to download a standalone brand app.	The Apple Wallet pass acts as a persistent connection, utilizing APNs push notifications (expiry warnings, bonus spin triggers) to pull the user back into the ecosystem without requiring the Arenza app to be actively open.

The Technical Blueprint: Sub-500ms Synchronization

Unlocking Scale: The 15-Minute SMB Pipeline

The Bottleneck: Local bar owners are not programmatic media buyers. Agency-level onboarding kills unit economics. The solution is a frictionless self-serve portal modeled on Roku Ads Manager.

Execution Roadmap: Weeks 1-36

Financial Viability: Single Node Unit Economics

The 4 Revenue Streams:

-  1. SaaS Subscription: \$79–\$299/mo operator access
-  2. CPM Fee: \$3–\$8 per 1k game impressions
-  3. POS Redemption Fee: \$0.05–\$0.15 per claim
-  4. Gift Card Interchange: 1.5% load fee

Mature State Calculations (Per Active Restaurant/Month):

- 22,500 game sessions (300 daily viewers x 2.5 spins x 30 days)
- 75% claim rate on a 35% win rate = 5,906 redemptions.

Base Sub (\$199) + Redemption Rev (\$590) + CPM Rev (\$112)

Gross Target: ~\$901 / month per restaurant

Measuring Success: Execution KPIs

Key Metric	Baseline Target	Mature Target
DAU/MAU Ratio	>20%	>40% 
Spins per Session	1.8	2.5+ 
Reward Claim Rate	>60%	>80% 
30-Day User Retention	>35%	>55% 
Advertiser Renewal Rate	>60%	>80% 

The Unfair Advantage

Arenza is not just another loyalty app or a FAST channel. It is a durable, mathematically sound architecture that delivers non-interruptive ad viewing, zero-party data capture, and closed-loop POS attribution. By solving companion app retention and SMB onboarding friction, Arenza transforms passive sports viewership into an active, hyper-local commerce engine.
